## ABOUT THIS REPORT

This report presents demographic data on the Hispanic or Latino population in Wisconsin. The Applied Population Laboratory at the University of Wisconsin, Madison prepared this report for the Hispanic Educational Needs Assessment Project as part of the cross-divisional effort by University of Wisconsin Extension. The results of Census 2000 are highlighted in a series of charts, maps, and tables covering basic demographic and socioeconomic characteristics of the Hispanic population in Wisconsin such as: size and distribution; age structure; composition of households and families; education; income and poverty; employment; housing and health care. This report covers data available from the 2000 Census with comparisons, in some cases, to data from the 1990 Census. Information from several Wisconsin state agencies is also presented.

The report is organized into eleven content sections. Generally, each section contains several maps or charts presenting data or trends that help paint a portrait of Hispanics or Latinos in Wisconsin. Attached to each map or chart is a short narrative which provides some discussion and highlights details in the data which might be of particular interest to readers. At the end of the report is a table section which provides the detailed data underlying most of the maps and charts. For quick reference, attached to most of the maps and charts is footnote indicating the table which contains the data used to create the graphic.

In making use of the data presented in this report, it is important to understand that, as defined by federal and state government agencies, race and ethnicity are separate concepts. Since the 1980 Census, ethnicity in census data has referred to whether a person is of Hispanic origin or not of Hispanic origin. So, people of a specific racial background (like white, black or American Indian) can be Hispanic or not Hispanic. Likewise, Hispanics can be of any race. While some discussion of racial identification of Hispanics or Latinos is included, most of the data presented is for all Hispanics regardless of race.

Finally, use of terminology and "labels" when talking about racial ethnic populations can be a sensitive issue. The authors of this report understand that Hispanic and Latino are often used interchangeably and there are some political, cultural and social preferences and implications in using one or the other term. While we would prefer to use both Hispanic and Latino in presenting this information, we have chosen to use Hispanic throughout the charts, maps and tables not only to simplify the labelling of data, but also to reflect the terminology and categorization used by federal and state government agencies.

The principal authors of this report are David Long (dlong@ssc.wisc.edu) and Dan Veroff (dlveroff@wisc.edu) of the Applied Population Laboratory. With appreciation and thanks, the authors would like to acknowledge the advice and assistance provided by Jeanette Karon, Jennifer Vogt, and Elizabeth Wilke. Each lent their immense skills and talents in preparing data, constructing tables and charts, and editing text. For more information about this report, the authors can be contacted at the address listed below.

## EXECUTIVE SUMMARY

## Wisconsin's Hispanic Population: Still small though growing fast

- Wisconsin's Hispanic or Latino population more than doubled from 93,232 in 1990 to 192,921 persons in 2000.
- The growth of the Hispanic population was especially rapid between 1990 and 2000 in Southeastern Wisconsin, where nearly $80 \%$ of Wisconsin's Hispanics reside.
- Some rural communities have experienced increases of over $300 \%$ in their Hispanic populations since 1990.
- Wisconsin's Hispanics are primarily Mexican in origin.

## Wisconsin's Hispanics differed in many ways from the total Wisconsin population in 2000

- A higher percentage of Hispanics resided in urban areas than that of the total Wisconsin population.
- There was higher mobility among Wisconsin's Hispanic population between 1995 and 2000 than in the total population. There was also a higher rate of in-migration to Wisconsin from a foreign country among Hispanics.
- Wisconsin's Hispanics had a younger median age than that of all Wisconsin residents combined
- There was a larger percentage of families among the Hispanic population, especially married parents with children and single parents with children.
- Hispanic families and households were slightly larger than the average Wisconsin family or household.
- There were larger percentages of female householders in all family types among Wisconsin Hispanics when compared to the total Wisconsin population.
- Among homeowners, the median value of Hispanic-owned homes was lower than that of all owner-occupied homes in Wisconsin. The percent of Hispanics that identified themselves as homeowners was also much lower than that in the total Wisconsin population.

## Wisconsin's Hispanics had lower levels of educational attainment and higher levels of poverty than the total Wisconsin population in 2000

- Over $25 \%$ of Wisconsin's Hispanics over the age of 25 had no high school education, although Hispanic women had higher levels of educational attainment than Hispanic men.
- Nearly $12 \%$ of Wisconsin's Hispanics earned less than $\$ 10,000$ in 1999, with most Hispanics earning less than $\$ 45,000$ in 1999.
- While there was still a gender gap in earnings among Hispanics, it was smaller than in the total Wisconsin population in 1999. However, the average Hispanic male earned the same as the average Wisconsin female in 1999.
- The Hispanic poverty rate in 2000 was more than twice the rate for all of Wisconsin. The combination of lower earnings and larger family size contributes to a greater risk of poverty for Hispanics.
- The counties with the highest rates of Hispanic poverty were scattered across the state in predominantly rural areas. Southeastern Wisconsin (with the exception of Milwaukee County) had the lowest rates of poverty despite a high Hispanic population.
- Hispanic men and women had higher rates of unemployment and non-participation in the labor force than in the total Wisconsin population in 2000. These rates have not improved since 1990.
- Hispanics in Wisconsin were more likely than non-Hispanics to not have health insurance or to be insured for only part of the year in 2000.

## Distribution of Hispanics (Numeric)

Maps 1 and 2 show the number of Hispanic persons in Wisconsin counties in 1990 and 2000. In both 1990 and 2000, Hispanics resided predominantly in the southeastern portion of the state. Although the Hispanic population increased significantly between 1990 and 2000, the general pattern shown in each of the maps remains similar; the counties with the most Hispanics in 1990 tended to have the most in 2000 as well.

Milwaukee County is shaded in gray, to distinguish it as having more then three times the Hispanic population of the second highest county both in 1990 and 2000. In 1990, only Milwaukee County had more than 10,000 Hispanics, by 2000 there were four Wisconsin counties with more than 10,000 persons of Hispanic origin: Milwaukee (82,406), Racine (14,990), Dane $(14,387)$, and Kenosha $(10,757)$.

## Maps 1 \& 2. Hispanic Population

Wisconsin Counties: 1990 \& 2000

see table 1 for map data

## Distribution of Hispanics (Percent)

Maps 3 and 4 show Hispanics as a percent of each Wisconsin county's total population. As with the maps of Hispanic population counts among Wisconsin counties, the distribution of Hispanics in terms of percent is also concentrated in the southeastern counties. In 2000, four counties in Wisconsin had Hispanic or Latino populations that exceed $5 \%$ of the total county population: Milwaukee ( $8.8 \%$ ), Racine ( $7.9 \%$ ), Kenosha (7.2\%), and Walworth (6.5\%).

The maps below show distinct patterns from the previous maps in several ways. First, Racine County, rather than Milwaukee County, had the highest percentage (5.2\%) of Hispanics in 1990. By 2000, however, Milwaukee County's population was 8.8 percent Hispanic, surpassing Racine and Kenosha which were 7.9 and 7.2 percent Hispanic. Second, Menominee County stood out among its neighbors in the Northeast, with a comparatively high concentration of Hispanics both in 1990 (2.2 percent) and 2000 (2.7 percent).

## Maps 3 \& 4. Percent Hispanic

see table 1 for man data

## Population Change (Numeric)

Maps 5 and 6 show the numerical change in the Hispanic population from 1980 to 1990 and from 1990 to 2000. Again, the pattern of growth reflects the existing centers of Hispanic population, with the greatest numeric increases occurring in counties in the southeast portion of the state. Between 1990 and 2000 a significant amount of growth also occurred in central Wisconsin extending North through the Fox Valley up to Brown County. Milwaukee County is again shown in gray to highlight the more dramatic numeric increase that occurred there in the two decades leading up to 2000.

Between 1990 and 2000, five counties experienced an increase of greater than 5,000 persons in their Hispanic populations: Milwaukee $(37,734)$, Dane $(8,643)$, Brown $(7,173)$, Racine $(5,956)$ and Kenosha $(5,177)$.

## Maps 5 \& 6. Hispanic Population Change

see table 1 for map data

## Population Change (Percent)

Maps 7 and 8 show the percent change in the Hispanic population from 1980 to 1990 and from 1990 to 2000. Although it is important to keep the small Hispanic base populations in some rural Wisconsin counties in mind, these maps highlight pronounced relative increases in Hispanic persons taking place outside the existing Hispanic population centers. The change in Hispanics in many of these areas may be small numerically, yet the impact on small communities can be significant often bringing new issues like the provision of public services to recent immigrant populations and provision of English as a second language classes in public schools.

Between 1990 and 2000, several counties experienced increases of over 300 percent growth in their Hispanic populations: Brown (470 percent), Iron (463 percent), Sauk (353 percent), Trempealeau (353 percent), and Washburn ( 321 percent). Most of these counties had fewer than 100 Hispanic persons in 1990, though Brown County's Hispanic population of 1,525 in 1990 was a notable exception.

## Maps 7 \& 8. Hispanic Population Percent Change

Wisconsin Counties: 1980-2000

see table 1 for map data

## County Shares

Chart 1 shows the distribution of Wisconsin's Hispanic population among counties. Milwaukee County contains by far the largest share, representing almost 43 percent of the state's total Hispanic population. Milwaukee County is followed by Racine, Dane, and Kenosha counties, each with less than 8 percent of the Hispanic population in 2000. Together, the eight counties listed on the chart below were home to nearly 80 percent of Wisconsin Hispanics in 2000

Chart 1. Distribution of Wisconsin's Hispanic Population, Wisconsin Counties: 2000

see table 2 for chart data

## Urban / Rural

Chart 2 illustrates the differences in urban and rural residence between Hispanics and the total Wisconsin population. Whereas almost one-third of Wisconsin's total population reported residing in a rural area in 2000, this described less than one-tenth of the Hispanic population

Chart 2. Urban/Rural Residence, Wisconsin: 2000

see table 3 for chart data

## Heritage

Census 2000 tabulated numerous sub-groups representing distinct ethnic identities within the Hispanic population. Chart 3 shows 7 heritage subgroups: Mexican, Puerto Rican, South American, Central American, Cuban, Dominican Republic, and the general category Other Hispanic or Latino.

Wisconsin Hispanics are predominantly of Mexican heritage (66 percent). The next largest category, Puerto Rican, is considerably smaller (16 percent), but still a significant share relative to the other four specified categories, each representing less than three percent of total Hispanics.

Chart 3. Heritage of Hispanics, Wisconsin: 2000

see table 4 for chart data

## Hispanics by Race

As discussed above, race and ethnicity are separate concepts in Census 2000 and the data emerges from answers to two different questions on the census form. Respondents are asked to answer both questions. The first asks whether the person is Spanish/Hispanic/Latino while the second asks the person to choose one or more race categories to identify themselves. In 2000, Hispanics in Wisconsin overwhelmingly identified their race as White alone ( $45.7 \%$ ) or Some Other Race alone ( $42.1 \%$ ). And, relative to the total population of Wisconsin, a large number of Hispanics identified themselves as being of Two or More races (7.8\%). There is some evidence that Hispanics were more likely to identify themselves in the Some Other Race or Two or more races categories and that they were more likely to "write in" their country of origin (such as Mexico, Honduras) on the census question about race. This may indicate some confusion around the distinction made by the census between ethnicity and race and that Hispanics have a hard time fitting themselves into the race categories presented as options. But, it also may mean that Hispanics have a strong cultural identity tied more to their country of origin than to their race or ethnicity.

Chart 4. Race of Hispanics, Wisconsin: 2000

see table 5 for chart data

## Birthplace

Chart 5 compares birthplace data for Wisconsin's total and Hispanic populations. Almost threequarters of the total Wisconsin population was born in Wisconsin, and less than one-sixth of those born outside of Wisconsin were born outside the U.S. In contrast, approximately as many Hispanics were born outside the United States as were born in Wisconsin (about $40 \%$ each). The only similarity in the two populations is in the proportion of persons in the category Born elsewhere in the United States which includes roughly one-fifth of the population in each.

Chart 5. Birthplace of Total Population \& Hispanics, Wisconsin: 2000

see table 6 for chart data

## Birthplace of Persons Born in Latin America

Chart 6 shows place of birth for those persons who reported being born in Latin America, thus giving further detail to our understanding of Hispanic migration streams into Wisconsin. Mexico, with an 82 percent share, is by far the most common birthplace among those born in Latin America. Birthplaces in South America, Central America, and the Caribbean account for significantly smaller segments (7, 6 and 5 percent, respectively) of the Latin American-born population.

## Chart 6. Birthplace of Persons Born in Latin America, Wisconsin: 2000

> see table 7 for chart data

## Year of Entry for Persons Born in Latin America

The 2000 Census asked all people born outside the United States to report the year in which they came to live in the United States. Chart 7 shows the resulting tabulation for those born in Latin America, highlighting the relatively recent entry of those born in Mexico, Central America, and South America. Except for persons of Caribbean origin, the number of in-migrants between 1990 and 2000 exceeds the total number of in-migrants prior to those years. This trend is most pronounced in the case of persons born in Mexico; those entering between 1990 and 2000 amount to almost twice the total from all previous years' entry.

Chart 7. Year of Entry for Persons Born in Latin America, Wisconsin: 2000

see table 8 for chart data

## Earlier Residence

In 2000, $43 \%$ of the total Wisconsin population had moved over the past 5 years, with the majority having moved within Wisconsin. However, Wisconsin's Hispanic population showed a different migration pattern, whereby nearly $67 \%$ had changed place of residence since 1995. Of the Hispanics who moved between 1995 and 2000, nearly 19\% had moved from outside the United States (including U.S. island areas with the exception of Puerto Rico). In contrast, less than $1 \%$ of the total Wisconsin population who moved had migrated from another country.

Chart 8. Movers' Place of Residence in 1995, Total and Hispanic Persons, Wisconsin: 2000

see table 9 for chart data

## Population Pyramid

Chart 9 illustrates the age differences between the Hispanic population in Wisconsin and the total Wisconsin population. The combination of high fertility and higher in-migration rates among young persons creates a broad "base" for the Hispanic pyramid. The lowest age category, children under age five, represents 12.8 percent of the total Hispanic population, compared with only 6.4 percent of all persons in Wisconsin. Within the upper age categories, there is also a stark contrast between the Hispanic and total Wisconsin populations. Persons over age 65 comprise only 3 percent of the Hispanic population, compared with 13 percent of Wisconsin's total population. Also noteworthy is the asymmetrical curve formed by the bars representing Hispanic males and females ages 15-34. This peculiarity is described further in Chart 12.

Chart 9. Total and Hispanic Population by Age and Sex, Wisconsin: 2000

see table 10 for chart data

## Median Age

Chart 10 illustrates median ages for the total Wisconsin population and Hispanics. The median ages for "Hispanic (of any race)" males and females ( 23.3 and 22.2 years) are significantly lower than those for the total population ( 35.0 and 37.1 years). For males, the difference is almost 12 years; for females, the gap widens to nearly 15 years.

Most of the median ages for the Hispanic heritage groups below vary little from those for the Total Hispanic population. The median ages of persons of Mexican, Puerto Rican and Other Hispanic heritage deviate from the total Hispanics' median ages by less than two years. The exception to these relative similarities is Cubans, whose median ages for males and females ( 31.2 and 26.1 years) are considerably higher than the medians of total Hispanics, though still lower than the median ages for the total Wisconsin population.

Chart 10. Median Age by Heritage and Sex, Wisconsin: 2000

see table 11 for chart data

## Population Under Age 15

Chart 11 shows the proportion of males and females under age 15, again comparing the Hispanic and total Wisconsin populations. Over 35 percent of Hispanic females and over 31 percent of Hispanic males are under age 15 , compared with less than 22 percent for each sex of the total Wisconsin population.

Chart 11. Population Under Age 15 by Sex, Wisconsin: 2000

[^0]
## Young Adults

Chart 12 shows the disparity in the number of Hispanic males and females between 16 and 30 years of age. The higher number of males compared to females in every category is generally attributed to differential migration patterns by sex among young Hispanic persons. The differences tend to diminish outside the ages highlighted here.

Chart 12. Young Hispanic Persons by Age and Sex, Wisconsin: 2000

see table 13 for chart data

## Living Arrangements

Chart 13 shows the proportion of Hispanics and the total Wisconsin population in various household living arrangements. The Census Bureau defines households as all the people occupying one housing unit (one place intended for separate occupancy). The term can apply to both family and non-family living arrangements. The data indicate that 76 percent of Hispanic households are families, compared with 67 percent of total Wisconsin households. Thus, a smaller proportion of Hispanic households are non-family households (persons who live alone or with someone not related by marriage, blood or adoption).

The chart also shows that roughly one-third ( 34 percent) of Hispanic households are married couples with children under age 18 , compared to less than one-fourth ( 24 percent) of the total population households. Furthermore, the proportion of single parents among Hispanic households is more than double that of the total population (18 versus 8 percent). Finally, almost one-third of the total population households (30 percent) are married couples with no children, but such arrangements are only half as prevalent among Hispanic households.

Chart 13. Types of Family and Non-Family Household Living Arrangements, Wisconsin: 2000

see table 14 for chart data

## Family Size

Chart 14 shows the variation in average family size among the total Wisconsin population, total Hispanics and several specific Hispanic heritage groups. Hispanic families are larger, on average, than families in the total Wisconsin population. Among Hispanics, the average number of persons per family is 3.8 , compared with 3.1 persons per family for the total Wisconsin population. Comparing specific Hispanic heritage groups also reveals differences in family size, ranging between 4.0 persons per family among Mexicans and 3.5 among Cubans.

Chart 14. Average Number of Persons in Families by Heritage, Wisconsin: 2000

see table 15 for chart data

## Household Size

Chart 15 shows differences in average household size among the total Wisconsin population, total Hispanics and several Hispanic heritage groups. The average size of Hispanic households is larger than the average for total Wisconsin households, with 3.5 persons and 2.5 persons, respectively. Among Hispanics, Mexicans have the largest average household size (3.7 persons) and Cubans have the smallest (2.7).

Chart 15. Average Number of Persons in Households by Heritage, Wisconsin: 2000

see table 16 for chart data

## Households with Non-Relatives

Chart 16 illustrates the prevalence of non-relatives living in households for the total Wisconsin population, total Hispanics and selected Hispanic heritage groups. Non-relatives include any household members that are not related to the householder by birth, marriage, or adoption, including foster children. Within Hispanic households of any heritage, non-relatives are present at more than twice the rate for that of Wisconsin's total households ( 22 percent versus 10 percent, respectively). Among Hispanic households, the presence of non-relatives is highest for those with householders of Mexican heritage ( 23 percent) and lowest for those with householders of Cubans heritage (16 percent).

Chart 16. Households by Presence of Non-Relatives and Heritage, Wisconsin: 2000

see table 17 for chart data

## Female Householders

Chart 17 shows the proportions of families with a female householder (no husband present). Compared with total Wisconsin families, Hispanic families are more likely to have a female householder. This is true for all three of the family and sub-family types shown below. Within all families, 22 percent of Hispanic families had female householders versus only 14 percent for total Wisconsin families. Among families with related children under 18 years, females headed 25 percent of Hispanic families and 20 percent of Wisconsin's total families. Finally, among families with related children under 6 years only, 22 percent of Hispanic families had female householders as opposed to 20 percent for total Wisconsin families.

Chart 17. Percent Female Householders within Selected Categories, Wisconsin: 2000

see table 18 for chart data

## Educational Attainment: 1990 and 2000

Chart 18 highlights significant differences between formal educational attainment of persons ages 25 years and older in the Hispanic population and the total Wisconsin population. For the year 2000, the percentage of Hispanics with less than a ninth grade education ( 25 percent) was approximately five times the percentage of the total Wisconsin population in that category ( 5 percent). The non-high school graduation rate among Hispanics ( 45 percent) is three times that of the total population ( 15 percent). The percentage of persons who did not graduate from high school was obtained by adding the two lowest educational attainment categories.

The chart also highlights the changes within each population group between 1990 and 2000. Educational attainment increased markedly between 1990 and 2000 for the total population but improved only slightly among Hispanics. The percentage of the total Wisconsin population that had at least a high school diploma increased from 79 percent to 85 percent. However, during the same interval the percentage of Hispanics in this category increased only slightly, from 54 to 55 percent.

Chart 18. Educational Attainment among Persons 25 Years or Older, Wisconsin: 1990 \& 2000

see table 19 for chart data

## Educational Attainment by Sex

Hispanic women have higher levels of formal educational attainment than Hispanic men. Chart 19 shows the share of the population within each educational category for each sex. There is a greater proportion of men in the categories with less than a high school diploma (including equivalency) and a greater proportion of women in the categories representing more than a high school education. Roughly the same proportions of Hispanic men and women are in the category of high school graduate (only).

The largest difference between the sexes is within the category representing the lowest level of educational attainment: those with less than a ninth grade education. Twenty-seven percent of Hispanic men fall into this group compared to only 23 percent of Hispanic women.

Chart 19. Educational Attainment by Sex among Hispanic Persons 25 Years and Older, Wisconsin: 2000

see table 20 for chart data

## Language Spoken

Chart 20 shows the proportion of Hispanic persons 5 years and over who speak Spanish at home and, among Spanish speakers, the proportion of persons with varying degrees of English-speaking proficiency. The first pie shows that about one-third ( 33 percent) of Hispanics speak English at home. The second pie shows that among Hispanics who speak Spanish at home, most also speak English well or very well. Persons who speak Spanish at home and do not speak English well, however, still comprise a significant share (21 percent) of the Hispanic population.

Chart 20. Language Spoken at Home for Hispanic Persons 5 Years and Over, Wisconsin: 2000

see table 21 for chart data

## Limited English Proficiency by District

The data shown in Chart 21 were provided by the Wisconsin Department of Public Instruction. The bars represent counts of Spanish-speaking students with limited English proficiency (LEP) by district. The Milwaukee district, with 5,059 Spanish-speaking LEP students, contains approximately 46 percent of Wisconsin's total. This district alone nearly eclipses the combined total of the remaining districts, each of which has fewer than 900 LEP Spanish speakers.

Chart 21. Top Ten Districts in Limited-English Proficient Spanish-Speaking Students, Wisconsin: March 1999

## Limited English Proficiency by Grade Group

Chart 22 shows a breakdown by grade grouping of Wisconsin's Spanish-speaking students with limited English proficiency (LEP). Moving from the $K-3$ group into the higher grade levels, the chart indicates a diminishing number of LEP students. Read optimistically, the diminution of the LEP student population in higher grades may suggest that Spanish-speaking students are gaining proficiency as they advance into higher grades; however, declining attendance rates may also be a contributing factor.

Chart 22. Limited-English Proficient Spanish-Speaking Students by Grade Group, Wisconsin: March 1999

## Median Household and Family Income

Because the Census Bureau does not collect data specifically on wealth, income is a commonly used surrogate for material well-being. Chart 23 shows a comparison between median household and family incomes for Hispanic and total Wisconsin households and families in 1999. The total Wisconsin household median approaches $\$ 44,000$ and the Hispanic household median is just under $\$ 35,000$, or about 80 percent of the total Wisconsin household median. The gap in median family income is wider, with total Wisconsin median family income at almost $\$ 53,000$ and the Hispanic median family income at under $\$ 36,000$. In this case, the Hispanic median is only 68 percent of the total Wisconsin median. The larger household and family sizes among Hispanics make these income gaps especially significant.

It is also noteworthy that disparities between total Wisconsin and Hispanic incomes have increased since 1979. In 1979, the total Wisconsin median household income was $\$ 17,680$ versus $\$ 15,382$ for Hispanic households. Among families, the total Wisconsin median income was $\$ 20,915$ versus $\$ 16,663$ for Hispanics. Hispanic median incomes were $87 \%$ and $84 \%$ of the Wisconsin totals, respectively.

Chart 23. Median Household and Family Income, Wisconsin: 1999

## Household Income Distribution

Chart 24 provides a more nuanced perspective on differences in household income, showing the percentages of households within specified income ranges for both Hispanic and total Wisconsin households. The income disparity is most apparent in the lowest range, Less than $\$ 10,000$, which includes just over 7 percent of total Wisconsin households but more than 12 percent of Hispanic households. A larger share of Hispanic households is found in each of the income categories below $\$ 45,000$. Among incomes $\$ 50,000$ and above, the relative difference between total Wisconsin and Hispanic household incomes within each category tends to increase, strongly favoring total Wisconsin households in the upper range. When grouped together, the share of households in the $\$ 60,000$ and above income categories represent 32 percent of total Wisconsin households though only 21 percent of Hispanic households.

Chart 24. Household Income Distribution, Wisconsin: 1999

see table 22 for chart data

## Median Earnings by Sex

Chart 25 shows a breakdown of earnings for the total and Hispanic populations by sex, revealing that the "gender gap" is much more pronounced in the total Wisconsin population than it is among Hispanics. Female workers in the total Wisconsin population earn approximately 70 cents on the dollar to male workers, while Hispanic female workers earn nearly 85 cents on the dollar compared with their male counterparts. Hispanic male workers, however, have median earnings similar to that of total Wisconsin female workers. The median earnings for Hispanic females is about $86 \%$ percent of the median for Wisconsin females, whereas the median income for Hispanic males is only $71 \%$ of the Wisconsin male population's median. Differences in earnings for workers within households help to explain the large gaps in household and family incomes shown previously.

Chart 25. Median Earnings by Sex among Year-Round, Full-Time Workers, Wisconsin: 1999

## Distribution of Hispanic Poverty

Maps 9 and 10 show the distribution of poverty across Wisconsin counties for Hispanics in 1999. Map 9 indicates that, numerically, the highest concentration of Hispanics in poverty tends to be in the southeast portion of the state, thus mirroring the Hispanic population totals to a large extent.

Map 10 reveals stark differences in poverty rates among Hispanics across counties. There are several counties where fewer than 10 percent of Hispanics live in poverty and several others in which the rates are 30 percent or higher. Those counties with rates of 30 percent or higher are predominantly rural counties with fewer than 200 Hispanics. They include: Florence ( 67 percent), Menominee ( 56 percent), Bayfield (39 percent), Buffalo ( 36 percent), Sauk ( 36 percent) and Shawano ( 30 percent). Although clustering of both high and low poverty counties appears limited, Map 10 seems to suggest that poverty rates among Hispanics tend to be lower in the Southeast, with the exception of Milwaukee County, where Hispanic populations tend to be larger.

## Maps 9 \& 10. Hispanic Poverty

Wisconsin Counties: 2000

see table 23 for chart data

## Poverty by Age

The overall poverty rate was 22.7 percent among Hispanics compared to 8.7 percent for Wisconsin's total population. Some of the differences in poverty rate are even more pronounced when looking at specific age groups. Chart 26 shows poverty rate by age for Hispanics and the total Wisconsin population. For the total Wisconsin population, 13 percent of people under five years old live in poverty. For Hispanics of the same ages, however, the rate is more than twice as high ( 27 percent). Within the category, 65 to 74 years, the poverty rate for Hispanics is almost three times that of the total Wisconsin population (14 and 5 percent, respectively). For both populations, the poverty rates tend to decline with age, with the exception of the significant jump in the poverty rate for the total Wisconsin population 75 years and over. In this final age category, the difference between the two populations is comparatively small ( 10 percent among the total Wisconsin population and 12 percent among Hispanics).

Chart 26. Percent of Total and Hispanic Population Below Poverty Level by Age, Wisconsin: 1999

see table 24 for chart data

## Poverty Status by Age: 1989 and 1999

Chart 27 presents the same poverty information for the Hispanic population in 1999 as the previous chart, and compares it with Hispanic poverty status in 1989. Between 1989 and 1999, considerable reductions in the poverty rates occurred among Hispanics in almost every age category. The most dramatic improvements in poverty rate are indicated at either end of the age range, among those under 5 years and those 75 years and over. For those under five, the poverty rate fell from 40 percent to 27 percent. Among those over 75, the poverty rate declined by nearly half, from 23 to 12 percent. The largest category numerically, those 18 to 64 years, experienced the least change, with the rate declining from 22 to 20 percent.

Chart 27. Percent of Hispanics Below Poverty Level by Age, Wisconsin: 1989 \& 1999

see tables 24 \& 25 for chart data

## Poverty Status for Female Householder Families

Families with a female householder represent a significant and increasing share of Wisconsin households both for Hispanics and the total population (see Chart 17). They are also more likely to be in poverty than married couple or male householder families.

Chart 28 shows the poverty rates for Hispanics and the total Wisconsin population for female-headed families in selected categories. There were significant differences in each family category. Among those with related children under 18, the Hispanic poverty rate was 15 points higher. The poverty rate of femaleheaded Hispanic families was highest ( 50 percent) among those With Related Children Under 5 years Only, 12 points higher than the comparable total Wisconsin rate. The Hispanic poverty rate was lowest and the percentage point difference between populations was smallest for female-headed families with No related children under 18 Years. In relative terms, however, the poverty rate for Hispanic families in this category (13 percent) was more than twice that of the total Wisconsin rate ( 6 percent). (Fix chart and page name refs.)

Chart 28. Families with Female Householders in Poverty by Presence of Related Children Under Age 18, Wisconsin: 1999

see table 26 for chart data

## Poverty Status of Families with Female Householders: 1989 and 1999

Chart 29 presents the same poverty information for female-headed Hispanic families as in the previous chart, juxtaposing it with 1989 rates. Two of the categories of female-householder families experienced a reduction in poverty rates between 1989 and 1999. In the With Related Children Under 18 Years category, poverty rates declined slightly. For the sub-group of families With Related Children Under 5 Years Only, the decline was more significant ( 6 percentage points). The decline was even larger for Hispanic female-householder families without children under 18; within this category the poverty rate more than doubled, from 6 to 13 percent.

Chart 29. Families with Female Householders in Poverty by Presence of Related Children, Wisconsin: 1989-1999

see table 27 for chart data

## Employment Status by Sex: Hispanic and Total

Chart 30 shows three categories of employment status, broken down by sex, for both the total Wisconsin and Hispanic populations ages 16 years and older. As with other tabulations presented in this chart book, differences in the age, sex, and household composition of populations can be important determinants of labor force status.

The fundamental differences in employment status for the Hispanic population versus the total Wisconsin population are true for each sex. That is, the percentage of males and females not in the labor force is slightly higher for Hispanics than for the total Wisconsin population. Similarly, the unemployment rates for Hispanic males and females are roughly double the rates for their counterparts in the total Wisconsin population. The remaining share, the proportion of persons employed or in the Armed Forces, is slightly higher among males and females in the total Wisconsin population than in the Hispanic population.

Chart 30. Employment Status for Persons Age 16 and Over by Sex, Wisconsin: 2000

see table 28 for chart data

## Employment Status by Sex: 1990 and 2000

Chart 31 below highlights changes in employment status within the Hispanic male and female populations between 1990 and 2000. The most notable changes between 1990 and 2000 were among Hispanic males. There was a significant increase in the share of Hispanic males not in the labor force (24 to 28 percent), and a nearly opposite reduction in the share of males employed or in the armed forces ( 68 to 65 percent). During this period there was also a 1.4 point reduction in the percentage of males who were unemployed.

The labor market status among Hispanic females underwent less marked changes between 1990 and 2000. Besides a small increase in the percentage of persons employed, a 1.4 point reduction in the unemployment rate was the most noteworthy change.

Chart 31. Employment Status for the Hispanic Population Age 16 and Over by Sex, Wisconsin: 1990 \& 2000

see table 29 for chart data

## Employment Status for Females by Presence of Children

Chart 32 provides a more detailed view of differences in labor market status among females in the total Wisconsin and Hispanic populations, grouped according to the presence and age of children. Aside from the differences in labor market participation rates discussed previously, the most notable distinction here between the total Wisconsin and Hispanic populations is the difference in labor force participation among females with no children under 18. Among total Wisconsin females, the participation rate is much lower for the No Own Children Under 18 Years group than for the other two groups ( $55 \%$ compared with $76 \%$ and $70 \%$ ). Among Hispanic females, however, the participation rates of those without children under 18 are roughly comparable to those in the other two categories. This difference likely reflects the age structure of females in the total Wisconsin and Hispanic populations (see chart 9), with a higher percentage of women over age 65 represented by the No Own Children Under 18 Years category within the total Wisconsin population.

Chart 32. Employment Status by Presence of Own Children Under Age 18, for Females Age 16 and Over, Wisconsin: 2000

see table 30 for chart data

## Housing Value

Chart 33 shows the median housing unit values for owner occupied units. In 2000, the median value for Wisconsin as a whole was $\$ 21,400$ greater ( 24 percent more) than the Hispanic median.

Chart 33. Median Housing Unit Value, Wisconsin: 2000

## Tenure

Chart 34 shows the percent of the total Wisconsin and Hispanic populations who live in owner occupied housing units, a figure used to describe home ownership. A smaller proportion of Hispanics (40 percent) live in owner occupied housing units compared with individuals in the total Wisconsin population (73 percent).

Among Hispanics, persons of Cuban and Other Hispanic origin had the highest occupancy rates (52 and 44 percent, respectively), and persons of Mexican and Puerto Rican heritage had the lowest ( 39 and 38 percent, respectively).

Chart 34. Persons in Owner Occupied Housing Units, Wisconsin: 2000

see table 31 for chart data

## Health Insurance

Chart 35 displays the rates of health insurance coverage in 2000. The data, provided by the Wisconsin Department of Health and Family Services, are included to complement the Census 2000 tabulations on Hispanic socioeconomic indicators.

This chart shows that Hispanics are almost four times as likely to have been uninsured than nonHispanic Whites ( 12 percent and 3 percent, respectively). They are also more than three times as likely as non-Hispanic Whites to have been insured for only a portion of the year ( 23 and 7 percent, respectively).

Chart 35. Health Insurance Coverage, Wisconsin: 2000

see table 32 for chart data

## Preventive Care

Chart 36 depicts differences in preventative care, measured by general physical exams and dental exams. The results are somewhat counterintuitive with respect to general physical exams. Non-Hispanic Whites were the least likely group to have had a general physical in the last year. The rate among Hispanics is estimated to be 6 points higher than the rate for non-Hispanic whites, making them the second most likely group overall to have had a general physical in the past year. Hispanics were also the second most likely group (69 percent) to have had a dental exam in the past year; although in this instance, non-Hispanic Whites had the highest rate ( 75 percent).

Though there is not cross-tabulation of this data available for age by racial/ethnic group, it appears likely that some of the unanticipated results reflect the younger age structure of racial/ethnic populations. Persons under 17 are among the most likely to have general physical and dental exams. So, for example, because Hispanics have a higher proportion of persons in this range, it seems likely that they would tend to have higher averages as a result.

Chart 36. General Physical and Dental Exams by Race / Ethnicity, Wisconsin: 2000

General Physical Exam in Past Year
Dental Visit in Past Year
see table 33 for chart data

## Hispanic-Owned Firms

Chart 37 shows the number and proportions of Hispanic-owned firms in Wisconsin as tabulated in the 1997 Economic Census. It indicates that there were 3,020 Hispanic-owned firms in that year, the majority of which were in the Industries Not Classified category. Service firms comprised the second largest share (30 percent), followed by Retail Trade and Construction firms with 16 and 8 percent shares, respectively.

Chart 37. Number of Hispanic-Owned Firms by Classification, Wisconsin: 2000

[^1]
## Hispanic-Owned Firms by Paid Employee Status

Chart 38 displays the proportion of Hispanic-owned firms with and without paid employees. These data, also from the 1997 economic census, show that the vast majority of firms have no paid employees, indicating, perhaps, that many Hispanic-owned businesses are operated by a sole owner-operator Of the 3,020 Wisconsin firms that are Hispanic-owned, only 494 firms (16 percent) have paid employees.

Chart 38. Hispanic-Owned Firms with and without Paid Employees,
Wisconsin: 2000
